Computers and computation are pervasive in our society. They play enormously important roles in areas as diverse as education, science, business, and the arts. Understanding the nature of computation and exploring the great potential of computers are the goals of the discipline of computer science. A sample of the areas of research investigated by the Williams Department of Computer Science alone illustrates the vast range of topics that are of interest to computer scientists and computing professionals today. This includes: the use of computer-generated graphic images in the arts and as a tool for visualization in the sciences and other areas; the protocols that make transmission of information over the Internet possible; the design of revolutionary new computer languages that simplify the process of constructing complex programs for computers; the development of machine learning algorithms that can extract useful and even novel information from data that is too complex for humans to analyze; algorithms that can solve problems that were previously too hard to solve in a reasonable amount of time, just by giving up a little bit of optimality in the solution; the investigation of machine architectures and specific hardware aimed at making computing fast.

The department recognizes that students' interests in computer science will vary widely. The department attempts to meet these varying interests through: (1) the major; (2) a selection of courses intended for those who are interested primarily in an introduction to computer science; (3) recommended course sequences for the non-major who wants a more extensive introduction to computer science in general or who seeks to develop some specific expertise in computing for application in some other discipline.

MAJOR

The goal of the major is to provide an understanding of algorithmic problem solving as well as the conceptual organization of computers and complex programs running on them. Emphasis is placed on the fundamental principles of computer science, building upon the mathematical and theoretical ideas underlying these principles. The introductory and core courses build a broad and solid base for understanding computer science. The more advanced courses allow students to sample a variety of specialized areas including graphics, artificial intelligence, computer architecture, networks, compiler design, human computer interaction, distributed systems, and operating systems. Independent study and honors work provide opportunities for students to study and conduct research on topics of special interest.

The major in Computer Science equips students to pursue a wide variety of career opportunities. It can be used as preparation for a career in computing, for graduate school, or to provide important background and techniques for the student whose future career will extend outside of computer science.

MAJOR REQUIREMENTS

Required Courses in Computer Science

A minimum of 8 courses is required in Computer Science, including the following:
Introductory Courses

- Computer Science 134 Introduction to Computer Science
- Computer Science 136 Data Structures and Advanced Programming

Core Courses

- Computer Science 237 Computer Organization
- Computer Science 256 Algorithm Design and Analysis
- At least one of the following:
  - Computer Science 334 Principles of Programming Languages
  - Computer Science 361 Theory of Computation

Elective Courses

Three or more electives (bringing the total number of Computer Science courses to at least 8) chosen from 300- or 400-level courses in Computer Science. If a student takes both Computer Science 334 and Computer Science 361, then one of the two may be counted as an elective. Computer Science courses with 9 as the middle digit (reading, research, and thesis courses) will normally not be used to satisfy the elective requirements. Students may petition the department to waive this restriction with good reason.

Elective courses in Computer Science fall into three categories: systems, theory and algorithms, and applications. In general, systems courses have 3 or 4 as the middle digit, theory and algorithms courses have 5 or 6 as the middle digit, and applications courses have 7 or 8 as the middle digit. Students are strongly encouraged to explore at least one elective course from each category.

Required Courses in Mathematics

Any Mathematics or Statistics course at the 200-level or higher in addition to the one used to satisfy the Discrete Math Proficiency Requirement.

Required Proficiency in Discrete Mathematics

Students must demonstrate proficiency in discrete mathematics by earning a grade of C- or better in MATH 200, MATH 328, MATH 334, or MATH 341. This requirement must be met by the end of the sophomore year.

The Department previously offered a Discrete Mathematics Proficiency Exam that could be used to fulfill the Discrete Math Proficiency requirement in lieu of a passing grade in MATH 200. The exam will be discontinued in Fall 2025. Students entering in Fall 2024 or later are not eligible to take the exam.

Students considering pursuing a major in Computer Science are urged to take Computer Science 134 and to begin satisfying their mathematics requirements early. Note in particular that the Discrete Mathematics Proficiency requirement is a prerequisite for many advanced courses.

Other Notes

- Students who take Computer Science 102T, 103, or 104 prior to Fall 2023 may use that course as one of the electives required for the major in Computer Science. Those classes cannot be counted toward the major if taken in Fall 2023 or later semesters. Computer Science 102T, 103, 104, and 134 are not open to students who have taken a Computer Science course numbered 136 or higher.

- To be eligible for admission to the major, a student must have completed at least two Computer Science courses, including Computer Science 136, as well as fulfilled the Discrete Mathematics Proficiency Requirement by the end of the sophomore year. A Mathematics or Statistics course at the 200-level or higher (in addition to the one used to satisfy the Discrete Math Proficiency Requirement) must be completed by the end of the junior year. Students are urged to have completed two core courses (Computer Science 237, 256, 334 or 361) by the end of the sophomore year and must normally have completed three core courses by the end of the junior year.

- We encourage students to be intellectually engaged in our field beyond the formal structure of courses. As such, all computer science majors must attend at least twenty Computer Science colloquia. Juniors and seniors are encouraged to attend at least five during each semester they are present on campus. Prospective majors in their first and second years are also encouraged to attend. A student studying away in a program approved by the International Education and Study Away Office will receive four colloquium credits for each semester away, up to a total of eight credits.

- With the advance permission of the department, two appropriate mathematics or statistics courses may be substituted for one Computer Science elective. Appropriate mathematics classes are those numbered 300 or above, and appropriate statistics courses are those numbered 200 or above. Other variations in the required courses, adapting the requirements to the special needs and interests of the individual student, may be arranged in consultation with the department.

LABORATORY FACILITIES

The Computer Science Department maintains four departmental computer laboratories for students taking Computer Science courses. The workstations in these laboratories also support student and faculty research in computer science.
THE DEGREE WITH HONORS IN COMPUTER SCIENCE

The degree with honors in Computer Science is awarded to students who have demonstrated outstanding intellectual achievement in a program of study extending beyond the requirements of the regular major. The principal considerations in recommending a student for the degree with honors will be: mastery of core material, ability to pursue independent study of computer science, originality in methods of investigation, and creativity in research. Honors study is highly recommended for those students with strong academic records in computer science who wish to attend graduate school, pursue high-level industrial positions in computing, or who would simply like to experience research in computer science.

Prospective honors students are urged to consult with their departmental advisor at the time of registration in the spring of the sophomore or at the beginning of the junior year to arrange a program of study that could lead to the degree with honors. Such a program normally consists of Computer Science 493 and 494 and a WSP of independent research under the guidance of a Computer Science faculty member, culminating in a thesis that is judged acceptable by the department. The program produces a significant piece of written work and often includes a major computer program. All honors candidates are required to give an oral presentation of their research in the Computer Science Colloquium in early spring semester.

Students considering honors work should obtain permission from the department before registering in the fall of the senior year. Formal admission to candidacy occurs at the beginning of the spring semester of the senior year and is based on promising performance in the fall semester and winter study units of honors work. Recommendations for the degree with honors will be made for outstanding performance in the three honors courses. Highest honors will be recommended for students who have displayed exceptional ability, achievement, or originality.

INTRODUCTORY COURSES

The department offers a choice of introductory courses; Computer Science 102 The Socio-Techno Web, 103 Electronic Textiles, 104 Data Science and Computation for All, and 134 Introduction to Computer Science.

Computer Science 134 provides an introduction to computer science with a focus on developing computer programming skills. These skills are essential to most upper-level courses in the department. As a result, Computer Science 134 together with Computer Science 136, are required as a prerequisite to most advanced courses in the department. Those students intending to take several Computer Science courses are urged to take 134 early.

Those students interested in learning more about exciting new ideas in computer science, but not necessarily interested in developing extensive programming skills, should consider Computer Science 102 The Socio-Techno Web, 103 Electronic Textiles, or 104 Data Science and Computation for All.

Students with significant programming experience should consider electing Computer Science 136 (see “Advanced Placement” below).

Please see https://csci.williams.edu/placement-for-introductory-computer-science-classes/ for more details on selecting among our classes. Students are always welcome to contact a member of the department for guidance in selecting a first course.

COMPUTER SCIENCE 134

Introduction to Computer Science covers fundamental concepts in the design, implementation and testing of computer programs including loops, conditionals, functions, elementary data types and recursion. There is a strong focus on constructing correct, understandable and efficient programs in a structured language such as Java or Python.

STUDY ABROAD

Study abroad can be a wonderful experience. Students who hope to take computer science courses while abroad should discuss their plans in advance with the chair of the department or the departmental study away advisor. Students who plan to study away but do not expect to take courses toward the major should work with the department to create a plan to ensure that they will be able to complete the major. While study abroad is generally not an impediment to completing the major, students should be aware that certain computer science courses must be taken in a particular sequence and that not all courses are offered every semester (or every year). Students who wish to discuss their plans are invited to meet with any of the faculty in Computer Science.

FAQ

Students MUST contact departments/programs BEFORE assuming study away credit will be granted toward the major or concentration.

Can your department or program typically pre-approve courses for major/concentration credit?

Yes, in some cases, if appropriate course information is available in advance (e.g. syllabi and/or course descriptions), though students should be sure to contact the department.

What criteria will typically be used/required to determine whether a student may receive major/concentration credit for a course taken while on study away?

Course title and description, and complete syllabus, including readings and assignments.

Does your department/program place restrictions on the number of major/concentration credits that a student might earn through study away?
Yes. Typically no more than two CSCI courses and one Math course.

Does your department/program place restrictions on the types of courses that can be awarded credit towards your major?

No.

Are there specific major requirements that cannot be fulfilled while on study away?

No.

Are there specific major requirements in your department/program that students should be particularly aware of when weighing study away options? (Some examples might include a required course that is always taught in one semester, laboratory requirements.)

Yes. Many CSCI electives are not taught every year. Students should develop a plan to complete all major requirements and discuss them with the department prior to going abroad.

Give examples in which students thought or assumed that courses taken away would count toward the major or concentration and then learned they wouldn’t:

Students must have courses pre-approved prior to going abroad to ensure they meet the curricular goals and standards of the department.

ADVANCED PLACEMENT

Students with an extensive background in computer science are urged to take the Advanced Placement Examination in Computer Science. A score of 4 or better on the AP Computer Science A exam is normally required for advanced placement in Computer Science 136. Students who receive a score of 4 or better on the AP Computer Science A exam are not eligible to take Computer Science 134.

Students who wish to be placed in Computer Science 136 but who have not taken the Advanced Placement Examination should consult with the department and arrange to take the departmental placement exam. Such students should have had a good course in computer science using a structured language such as Java or Python.

PLANS OF STUDY FOR NON-MAJORS

The faculty in Computer Science believes that students can substantially enrich their academic experience by completing a coherent plan of study in one or more disciplines outside of their majors. With this in mind, we have attempted to provide students majoring in other departments with options in our department’s curriculum ranging from two-course sequences to collections of courses equivalent to what would constitute a minor at institutions that recognize such a concentration. Students interested in designing such a plan of study are invited to discuss their plans in detail with a member of the faculty. To assist students making such plans, we include some suggestions below.

Students seeking to develop an extensive knowledge of computer science without majoring in the department are encouraged to use the major requirements as a guide. In particular, the core courses required of majors are intended to provide a broad knowledge of topics underlying all of computer science. Students seeking a concentration in Computer Science are urged to complete at least two of these courses followed by one of our upper-level electives. Such a program would typically require the completion of a total of five Computer Science courses in addition to the Discrete Mathematics Proficiency requirement.

There are several sequences of courses appropriate for those primarily interested in developing skills in programming for use in other areas. For general programming, Computer Science 134 followed by 136 and 256 will provide students with a strong background in algorithm and data structure design together with an understanding of issues of correctness and efficiency. Students of the Bioinformatics program are encouraged to take Computer Science 134 at a minimum, and should also consider Computer Science 136 and 256. Students interested in Data Science should take Computer Science 134, 136, 256, and at least one elective with a 7 or 8 as the middle digit. For engineering students, we recommend Computer Science 134 followed by 136 and 237.

There are, of course, many other alternatives. We encourage interested students to consult with the department chair or other members of the department’s faculty.

GENERAL REMARKS

Divisional Requirements

All Computer Science courses may be used to satisfy the Division III distribution requirement.

Alternate Year Courses

Computer Science 102, 103, 104, and our electives are each usually offered at least every other year. All other Computer Science courses are normally offered every year.

Course Numbering

The increase from 100, through 200 and 300, to 400 indicates in most instances an increasing level of maturity in the subject that is expected of students. Within a series, numeric order does not indicate the relative level of difficulty of courses. Rather, the middle digit of the course number (particularly in upper-level courses) generally indicates the area of computer science covered by the course.
Course Descriptions

Brief descriptions of the courses in Computer Science can be found below. More detailed information on the offerings in the department is available at http://www.cs.williams.edu/.

Courses Open on a Pass-Fail Basis

Students taking a Computer Science course on a pass-fail basis must meet all the requirements set for students taking the course on a graded basis.

With the permission of the department, any course offered by the department may be taken pass-fail (with the exception of tutorials), though courses graded with the pass-fail option may not be used to satisfy any of the major or honors requirements. However, with the permission of the department, courses taken in the department beyond those requirements may be taken on a pass-fail basis.

CSCI 103  (S)  Electronic Textiles  (QFR)

Digital data is being infused throughout the entire physical world, escaping the computer monitor and spreading to other devices and appliances, including the human body. Electronic textiles, or eTextiles, is one of the next steps toward making everything interactive and this course aims to introduce learners to the first steps of developing their own wearable interactive technology devices. After completing a series of introductory eTextiles projects to gain practice in necessary sewing, circuitry, and programming skills, students will propose and design their own eTextiles projects, eventually implementing them with sewable Arduino components, and other found electronic components as needed. The scope of the project will depend on the individual's prior background, but can include everything from a sweatshirt with light-up turn signals for bicycling, to a wall banner that displays the current air quality of the room, to a stuffed animal that plays a tune when the lights go on, to whatever project you can conceivably accomplish with sewable Arduino inputs, outputs, and development board in a semester context. This class will introduce students to introductory computer programming, circuitry, and sewing with the goal of creating novel wearable artifacts that interact with the world.

Class Format: interspersed with hands-on activities in a computer lab

Requirements/Evaluation: weekly homework assignments and a final project

Prerequisites: none

Enrollment Limit: 18

Enrollment Preferences: students who have not previously taken a CSCI course

Expected Class Size: 18

Grading: yes pass/fail option, yes fifth course option

Unit Notes: Please see the Computer Science Department website for more information on selecting an introductory computer science class: https://csci.williams.edu/

Materials/Lab Fee: a fee of $95 will be added to term bill to cover Lilypad Arduino components (Protosnap Plus Kit, battery holders, sets of LEDs, temperature sensor, vibe board, tri-color LED), alligator test leads, fabric, thread & fabric scissors.

Distributions: (D3)  (QFR)

Quantitative/Formal Reasoning Notes: The course will teach students the basics of computer programming through projects in which quantitative/formal reasoning skills are practiced and evaluated.

Not offered current academic year

CSCI 104  (F)  Data Science and Computing for All  (QFR)

Many of the world's greatest discoveries and most consequential decisions are enabled or informed by the analysis of data from a myriad of sources. Indeed, the ability to wrangle, visualize, and draw conclusions from data is now a critical tool in the sciences, business, medicine, politics, other academic disciplines, and society as a whole. This course lays the foundations for quantifying relationships in data by exploring complementary computational, statistical, and visualization concepts. These concepts will be reinforced by lab experiences designed to teach programming and statistics skills while analyzing real-world data sets. This course will also examine the broader context and social issues surrounding data analysis, including privacy and ethics.

Requirements/Evaluation: Weekly lab assignments involving programming, a project, and examinations.

Prerequisites: None; previous programming experience or statistics is not required.
CSCI 134  (F)(S)  Introduction to Computer Science  (QFR)

This course introduces students to the science of computation by exploring the representation and manipulation of data and algorithms. We organize and transform information in order to solve problems using algorithms written in a modern object-oriented language. Topics include organization of data using objects and classes, and the description of processes using conditional control, iteration, methods and classes. We also begin the study of abstraction, self-reference, reuse, and performance analysis. While the choice of programming language and application area will vary in different offerings, the skills students develop will transfer equally well to more advanced study in many areas. In particular, this course is designed to provide the programming skills needed for further study in computer science and is expected to satisfy introductory programming requirements in other departments.

Requirements/Evaluation: weekly programming projects, weekly written homeworks, and two examinations.

Prerequisites: none, except for the standard prerequisites for a (QFR) course; previous programming experience is not required

Enrollment Limit: 30/lec

Enrollment Preferences: if the course is over-enrolled, enrollment will be determined by lottery.

Expected Class Size: 30/lec

Grading:  yes pass/fail option,  yes fifth course option

Unit Notes: Please see the Computer Science Department website for more information on selecting an introductory computer science class: https://csci.williams.edu/. Students with prior experience with object-oriented programming should discuss appropriate course placement with members of the department.

Distributions: (D3) (QFR)

Quantitative/Formal Reasoning Notes: This course includes regular and substantial problem sets, labs, and/or projects in which quantitative/formal reasoning skills are practiced and evaluated.

Attributes:  COGS Interdepartmental Electives
CSCI 136  (F)(S)  Data Structures and Advanced Programming  (QFR)
This course builds on the programming skills acquired in Computer Science 134. It couples work on program design, analysis, and verification with an introduction to the study of data structures. Data structures capture common ways in which to store and manipulate data, and they are important in the construction of sophisticated computer programs. Students are introduced to some of the most important and frequently used data structures: lists, stacks, queues, trees, hash tables, graphs, and files. Students will be expected to write several programs, ranging from very short programs to more elaborate systems. Emphasis will be placed on the development of clear, modular programs that are easy to read, debug, verify, analyze, and modify.

Requirements/Evaluation:  programming and written assignments, quizzes, examinations
Prerequisites:  CSCI 134 or equivalent; fulfilling the Discrete Mathematics Proficiency requirement is recommended, but not required
Enrollment Limit:  30;15/lab
Enrollment Preferences:  if the course is over-enrolled, enrollment will be determined by lottery.
Expected Class Size:  30/lec
Grading:  yes pass/fail option,  no fifth course option
Unit Notes:  Please see the Computer Science Department website for more information on selecting an introductory computer science class:  
https://csci.williams.edu/
Distributions:  (D3)  (QFR)
Quantitative/Formal Reasoning Notes:  This course include regular and substantial problem sets, labs, and/or projects in which quantitative/formal reasoning skills are practiced and evaluated.
Attributes:  BIGP Courses

Fall 2024
LEC Section:  01  MWF 9:00 am - 9:50 am  James M. Bern
LEC Section:  02  MWF 10:00 am - 10:50 am  James M. Bern
LAB Section:  03  W 1:00 pm - 2:30 pm  James M. Bern
LAB Section:  04  W 2:30 pm - 4:00 pm  James M. Bern
LAB Section:  05  R 1:00 pm - 2:30 pm  James M. Bern
LAB Section:  06  R 2:30 pm - 4:00 pm  James M. Bern
Spring 2025
LEC Section:  01  MWF 9:00 am - 9:50 am  Katie A. Keith
CSCI 237  (F)(S)  Computer Organization  (QFR)
This course studies the basic instruction set architecture and organization of a modern computer. It provides a programmer's view of how computer systems execute programs, store information, and communicate. Over the semester the student learns the fundamentals of translating higher level languages into assembly language, and the interpretation of machine languages by hardware. At the same time, a model of computer hardware organization is developed from the gate level upward.

Requirements/Evaluation: weekly programming assignments and/or problem sets, quizzes, midterm and final exams
Prerequisites: CSCI 136
Enrollment Limit: 24;12/lab
Enrollment Preferences: current or expected Computer Science majors
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3)  (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.
Grading:  no pass/fail option,  no fifth course option
Distributions:  (D3)  (QFR)

Quantitative/Formal Reasoning Notes: This course will have weekly problem sets in which students will formally prove statements about the behavior and performance of algorithms. In short, the course is about applying abstract and mathematical reasoning to the study of algorithms and computation.

Fall 2024
LEC Section: 01  MWF 12:00 pm - 12:50 pm  Aaron M. Williams

Spring 2025
LEC Section: 01  MR 1:10 pm - 2:25 pm  Samuel McCauley
LEC Section: 02  MR 2:35 pm - 3:50 pm  Samuel McCauley

CSCI 315  (F)  Computational Biology  (QFR)

Cross-listings:  PHYS 315
Secondary Cross-listing

This course will provide an overview of Computational Biology, the application of computational, mathematical, statistical, and physical problem-solving techniques to interpret the rapidly expanding amount of biological data. Topics covered will include database searching, DNA sequence alignment, clustering, RNA structure prediction, protein structural alignment, methods of analyzing gene expression, networks, and genome assembly using techniques such as string matching, dynamic programming, hidden Markov models, and statistics.

Requirements/Evaluation:  weekly Python programming assignments, code reviews, problem sets, plus a few quizzes and a final project
Prerequisites:  programming experience (e.g., CSCI 136) and mathematics (PHYS/MATH 210 or MATH 150) and physical science (PHYS 142/151, or CHEM 101/15X), or permission of instructor
Enrollment Limit:  10
Enrollment Preferences:  if over-enrolled, a questionnaire will be circulated
Expected Class Size:  8
Grading:  no pass/fail option,  no fifth course option
Distributions:  (D3)  (QFR)

This course is cross-listed and the prefixes carry the following divisional credit:
CSCI 315(D3)  PHYS 315(D3)

Quantitative/Formal Reasoning Notes: problem sets and programming assignments
Attributes:  BIGP Courses

Fall 2024
LEC Section: 01  MR 2:35 pm - 3:50 pm  Daniel P. Aalberts

CSCI 319  (S)  Integrative Bioinformatics, Genomics, and Proteomics Lab  (QFR)

Cross-listings:  BIOL 319 / CHEM 319 / PHYS 319 / MATH 319
Secondary Cross-listing

What can computational biology teach us about cancer? In this lab-intensive experience for the Genomics, Proteomics, and Bioinformatics program, computational analysis and wet-lab investigations will inform each other, as students majoring in biology, chemistry, computer science, mathematics/statistics, and physics contribute their own expertise to explore how ever-growing gene and protein data-sets can provide key insights into human disease. In this course, we will take advantage of one well-studied system, the highly conserved Ras-related family of proteins, which play a central role in numerous fundamental processes within the cell. The course will integrate bioinformatics and molecular biology, using database searching, alignments and pattern matching, and phylogenetics to reconstruct the evolution of gene families by focusing on the gene duplication events and gene rearrangements that have occurred over the course of eukaryotic speciation. By utilizing high through-put approaches to investigate genes involved in the inflammatory and MAPK signal transduction pathways in human colon cancer cell lines, students will uncover regulatory
mechanisms that are aberrantly altered by siRNA knockdown of putative regulatory components. This functional genomic strategy will be coupled with independent projects using phosphorylation-state specific antisera to test our hypotheses. Proteomic analysis will introduce the students to de novo structural prediction and threading algorithms, as well as data-mining approaches and Bayesian modeling of protein network dynamics in single cells. Flow cytometry and mass spectrometry may also be used to study networks of interacting proteins in colon tumor cells.

Class Format: The lab for this course will meet for two afternoons per week. Some lab sessions will be shorter than 3 hours.

Requirements/Evaluation: lab participation, several short homework assignments, one lab report, a programming project, and a grant proposal

Prerequisites: BIOL 202; students who have not taken BIOL 202 but have taken BIOL 101 and a CSCI course, or CSCI/PHYS 315, may enroll with permission of instructor. No prior computer programming experience is required.

Enrollment Limit: 12

Enrollment Preferences: seniors, then juniors, then sophomores

Expected Class Size: 12

Grading: yes pass/fail option, no fifth course option

Distributions: (D3) (QFR)

This course is cross-listed and the prefixes carry the following divisional credit:
BIOL 319(D3) CHEM 319(D3) CSCI 319(D3) PHYS 319(D3) MATH 319(D3)

Quantitative/Formal Reasoning Notes: Through lab work, homework sets and a major project, students will learn or further develop their skills in programming in Python, and about the basis of Bayesian approaches to phylogenetic tree estimation.

Attributes: BIGP Courses BIMO Interdepartmental Electives

Not offered current academic year

CSCI 331 (F) Introduction to Computer Security (QFR)

This class explores common vulnerabilities in computer systems, how attackers exploit them, and how systems engineers design defenses to mitigate them. The goal is to be able to recognize potential vulnerabilities in one's own software and to practice defensive design. Hands-on experience writing assembly language and C code to inspect and modify the low-level operation of running programs is emphasized. Finally, regular reading and writing assignments round out the course to help students understand the cultural and historical background of the computer security "arms race."

Class Format: This course has twice-weekly lecture meetings as well as a weekly lab meeting.

Requirements/Evaluation: weekly reading responses, lab assignments, midterm exam, and final project

Prerequisites: CSCI 237

Enrollment Limit: 24(12/lab)

Enrollment Preferences: upper-level students

Expected Class Size: 24

Grading: no pass/fail option, no fifth course option

Materials/Lab Fee: A fee of $75-$100 will be added to the term bill to cover the purchase of a Raspberry Pi computer and accessories.

Distributions: (D3) (QFR)

Quantitative/Formal Reasoning Notes: This course include regular and substantial problem sets and labs in which quantitative/formal reasoning skills are practiced and evaluated.

Not offered current academic year

CSCI 334 (S) Principles of Programming Languages (QFR)

This course examines the concepts and structures governing the design and implementation of programming languages. It presents an introduction to the concepts behind compilers and run-time representations of programming languages; features of programming languages supporting abstraction and polymorphism; and the procedural, functional, object-oriented, and concurrent programming paradigms. Programs will be required in languages illustrating each of these paradigms.

Requirements/Evaluation: weekly problem sets and programming assignments, a midterm examination, and a final examination

Prerequisites: CSCI 136

Enrollment Limit: 30
Enrollment Preferences: current or expected Computer Science majors

Expected Class Size: 30

Grading: yes pass/fail option, no fifth course option

Distributions: (D3) (QFR)

Quantitative/Formal Reasoning Notes: This course include regular and substantial problem sets and labs in which quantitative/formal reasoning skills are practiced and evaluated.

Spring 2025

LEC Section: 01 MR 1:10 pm - 2:25 pm Daniel W. Barowy
LEC Section: 02 MR 2:35 pm - 3:50 pm Daniel W. Barowy

CSCI 338 (S) Parallel Processing (QFR)
This course explores different parallel programming paradigms used for writing applications on today's parallel computer systems. The course will introduce concurrency (i.e. multiple simultaneous computations) and the synchronization primitives that allow for the creation of correct concurrent applications. It will examine how a variety of systems organize parallel processing resources and enable users to write parallel programs for these systems. Covered programming paradigms will include multiprogramming with processes, message passing, threading in shared memory multiprocessors, vector processing, graphics processor programming, transactions, MapReduce, and other forms of programming for the cloud. Class discussion is based on assigned readings. Assignments provide students the opportunity to develop proficiency in writing software using different parallel programming paradigms.

Requirements/Evaluation: homework assignments, programming projects, and up to two exams
Prerequisites: CSCI 136 or equivalent programming experience, and CSCI 237, or permission of instructor
Enrollment Limit: 24
Enrollment Preferences: current or expected Computer Science majors

Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of substantial problem sets and programming assignments in which quantitative/formal reasoning skills are practiced and evaluated.

Spring 2025
LEC Section: 01 TR 9:55 am - 11:10 am Kelly A. Shaw

CSCI 339 (F) Distributed Systems (QFR)
This course studies the key design principles of distributed systems, which are collections of independent networked computers that function as single coherent systems. Covered topics include communication protocols, processes and threads, naming, synchronization, consistency and replication, fault tolerance, and security. Students also examine some specific real-world distributed systems case studies, including Google and Amazon. Class discussion is based on readings from the textbook and research papers. The goals of this course are to understand how large-scale computational systems are built, and to provide students with the tools necessary to evaluate new technologies after the course ends.

Requirements/Evaluation: weekly homework assignments, midterm exam, 3 major programming projects, and a final project
Prerequisites: CSCI 237
Enrollment Limit: 24
Enrollment Preferences: current or expected Computer Science majors

Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal
reasoning skills are practiced and evaluated.

Fall 2024
LEC Section: 01 MR 1:10 pm - 2:25 pm Jeannie R Albrecht

CSCI 345 (S) Robotics and Digital Fabrication (QFR)
This course is a hands-on exploration of topics in robotics and digital fabrication. We will experience firsthand how ideas and methods from computer science can be applied to make physical objects, including robots and other machines. The emphasis will be on creative, hands-on experimentation. Along the way, students will learn the basics of embedded systems programming (Arduino), breadboarding, soldering, printed circuit board (PCB) design, mechanical computer-aided design (CAD)—both conventional (OnShape) and programmatic (OpenSCAD)—as well digital fabrication (3D-printing, laser cutting). Students will learn both how to build their own prototypes and how to send out designs to have parts machined professionally. Students will work in teams throughout. The course will culminate in a team robotic design competition testing both functionality and creativity.

Requirements/Evaluation: Evaluation based on assignments, projects, and exams.
Prerequisites: CSCI 237
Enrollment Limit: 18; 9/lab
Enrollment Preferences: Current or expected Computer Science majors
Expected Class Size: 18
Grading: no pass/fail option, no fifth course option
Materials/Lab Fee: A fee of $150-$200 will be added to the term bill to cover the purchase of consumable electronics, motors, 3D-printing filament, and stock used in the assignments and final project.
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will include programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.

Spring 2025
LEC Section: 01 TR 9:55 am - 11:10 am James M. Bern
LAB Section: 02 T 1:00 pm - 2:30 pm James M. Bern
LAB Section: 03 T 2:30 pm - 4:00 pm James M. Bern

CSCI 357 (S) Algorithmic Game Theory (QFR)
This course focuses on topics in game theory and mechanism design from a computational perspective. We will explore questions such as: how to design algorithms that incentivize truthful behavior, that is, where the participants have no incentive to cheat? Should we let drivers selfishly minimize their commute time or let a central algorithm direct traffic? Does Arrow's impossibility result mean that all voting protocols are doomed? The overarching goal of these questions is to understand and analyze selfish behavior and whether it can or should influence system design. Students will learn how to model and reason about incentives in computational systems both theoretically and empirically. Topics include types of equilibria, efficiency of equilibria, auction design and mechanism design with money, two-sided markets and mechanism design without money, incentives in computational applications such as P2P systems, and computational social choice.

Requirements/Evaluation: weekly problem sets and/or programming assignments, two midterm exams, and a final project.
Prerequisites: CSCI 256
Enrollment Limit: 24
Enrollment Preferences: current or expected Computer Science majors
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist problem sets and programming assignments in which quantitative/formal reasoning skills are practiced and evaluated.
Spring 2025

LEC Section: 01    TF 1:10 pm - 2:25 pm     Shikha  Singh

CSCI 358  (F)  Applied Algorithms  (QFR)
This course is about bridging the gap between theoretical running time and writing fast code in practice. The course is divided into two basic topics. The first is algorithmic: we will discuss some of the most useful tools in a coder's toolkit. This includes topics like randomization (hashing, filters, approximate counters), linear and convex programming, similarity search, and cache-efficient algorithms. Our goal is to talk about why these efficient algorithms make seemingly difficult problems solvable in practice. The second topic is applications: we will discuss how to implement algorithms in an efficient way that takes advantage of modern hardware. Specific topics covered will include blocking, loop unrolling, pipelining, as well as strategies for performance analysis. Projects and assessments will include both basic theoretical aspects (understanding why the algorithms we discuss actually work), and practical aspects (implementing the algorithms we discuss to solve important problems, and optimizing the code so it runs as quickly as possible).

Requirements/Evaluation: Over the course of each week, there will be either a homework or an assignment. Homeworks and assignments have similar structure, with both a coding and problem set component, but assignments will be weighted more heavily and must be completed individually. There will also be a take home final at the end of the year.

Prerequisites: CSCI 256 and CSCI 237

Enrollment Limit: 24

Enrollment Preferences: current or expected Computer Science majors

Expected Class Size: 24

Grading:  no pass/fail option,  no fifth course option

Distributions:  (D3)  (QFR)

Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.

Fall 2024

LEC Section: 01    TF 1:10 pm - 2:25 pm     Samuel  McCauley

CSCI 361  (F)  Theory of Computation  (QFR)

Cross-listings: MATH 361

Primary Cross-listing

This course introduces a formal framework for investigating both the computability and complexity of problems. We study several models of computation including finite automata, regular languages, context-free grammars, and Turing machines. These models provide a mathematical basis for the study of computability theory--the examination of what problems can be solved and what problems cannot be solved--and the study of complexity theory--the examination of how efficiently problems can be solved. Topics include the halting problem and the P versus NP problem.

Requirements/Evaluation: weekly problem sets and one or more exams

Prerequisites: CSCI 256 or both a 300-level MATH course and permission of instructor

Enrollment Limit: 24

Enrollment Preferences: current or expected Computer Science majors

Expected Class Size: 24

Grading:  no pass/fail option,  no fifth course option

Distributions:  (D3)  (QFR)

This course is cross-listed and the prefixes carry the following divisional credit:

MATH 361(D3) CSCI 361(D3)

Quantitative/Formal Reasoning Notes: This course include regular and substantial problem sets in which quantitative/formal reasoning skills are practiced and evaluated.
CSCI 371 (S) Computer Graphics (QFR)
This course covers the fundamental mathematics and techniques behind computer graphics, and will teach students how to represent and draw 2D and 3D geometry for real-time and photorealistic applications. Students will write challenging implementations from the ground up in C/C++, OpenGL, and GLSL. Topics include transformations, rasterization, ray tracing, immediate mode GUI, forward and inverse kinematics, and physically-based animation. Examples are drawn from video games, movies, and robotics.

Requirements/Evaluation: evaluation based on assignments, projects, and exams.
Prerequisites: CSCI 237
Enrollment Limit: 24;12/lab
Enrollment Preferences: current or expected Computer Science majors
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.

Not offered current academic year

CSCI 373 (S) Artificial Intelligence (QFR)
Artificial Intelligence (AI) has become part of everyday life, but what is it, and how does it work? This course introduces theories and computational techniques that serve as a foundation for the study of artificial intelligence. Potential topics include the following: Problem solving by search, Logic, Planning, Constraint satisfaction problems, Reasoning under uncertainty, Probabilistic graphical models, and Automated Learning.

Requirements/Evaluation: Evaluation based on assignments, projects, and exams.
Prerequisites: CSCI 136 and (CSCI 256 or permission of instructor)
Enrollment Limit: 24
Enrollment Preferences: current or expected Computer Science majors
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.

Attributes: COGS Interdepartmental Electives
Not offered current academic year

CSCI 374 (F) Machine Learning (QFR)
Machine learning is a field that derives from artificial intelligence and statistics, and is concerned with the design and analysis of computer algorithms that "learn" automatically through the use of data. Computer algorithms are capable of discerning subtle patterns and structure in the data that would be practically impossible for a human to find. As a result, real-world decisions, such as treatment options and loan approvals, are being increasingly automated based on predictions or factual knowledge derived from such algorithms. This course explores topics in supervised learning (e.g., random forests and neural networks), unsupervised learning (e.g., k-means clustering and expectation maximization), and possibly reinforcement learning (e.g., Q-learning and temporal difference learning.) It will also introduce methods for the evaluation of learning algorithms (with an emphasis on analysis of generalizability and robustness of the algorithms to distribution/environmental shift), as well as topics in computational learning theory and...
CSCI 375  (F) Natural Language Processing (QFR)
Natural language processing (NLP) is a set of methods for making human language accessible to computers. NLP underlies many technologies we use on a daily basis including automatic machine translation, search engines, email spam detection, and automated personalized assistants. These methods draw from a combination of algorithms, linguistics and statistics. This course will provide a foundation in building NLP models to classify, generate, and learn from text data.

Requirements/Evaluation: Evaluation based on assignments, projects, and exams.
Prerequisites: CSCI 136, and either CSCI 256 or STAT 201/202.
Enrollment Limit: 24
Enrollment Preferences: current or expected Computer Science majors.
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.
Attributes: COGS Interdepartmental Electives

Fall 2024

CSCI 376  (F)(S) Human-Computer Interaction

Cross-listings: STS 376

Primary Cross-listing
Human-Computer Interaction (HCI) principles are practiced in the design and evaluation of most software, greatly impacting the lives of anyone who uses interactive technology and other products. There are many ways to design and build applications for people, so what methods can increase the likelihood that our design is the most useful, intuitive, and enjoyable? This course provides an introduction to the field of human-computer interaction, through a user-centered approach to designing and evaluating interactive systems. HCI draws on methods from computer science, the social and cognitive sciences, and interaction design. In this course we will use these methods to: ideate and propose design problems, study existing systems and challenges, explore design opportunities and tradeoffs, evaluate and improve designs, and communicate design problems and solutions to varying audiences.

Requirements/Evaluation: course projects, in-class group work/participation, and exams
Prerequisites: CSCI 136
CSCI 378 (S) Human Artificial Intelligence Interaction

**Cross-listings:** STS 378

**Primary Cross-listing**

Artificial intelligence (AI) is already transforming society and every industry today. In order to ensure that AI serves the collective needs of humanity, we as computer scientists must guide AI so that it has a positive impact on the human experience. This course is an introduction to harnessing the power of AI so that it benefits people and communities. We will cover a number of general topics such as: agency and initiative, AI and ethics, bias and transparency, confidence and errors, human augmentation and amplification, trust and explainability, and mixed-initiative systems. We explore these topics via readings and projects across the AI spectrum, including: dialog and speech-controlled systems, computer vision, data science, recommender systems, text summarization, and UI personalization, among others.

**Class Format:** Lecture content is delivered via video, and in-class time will be spent doing hands-on activities or in group discussion.

**Requirements/Evaluation:** homework, programming assignments, group work, participation, and quizzes

**Prerequisites:** CSCI 136, and at least one of CSCI 237, 256, or 334

**Enrollment Limit:** 24

**Enrollment Preferences:** current or expected Computer Science majors

**Expected Class Size:** 24

**Grading:** yes pass/fail option, no fifth course option

**Distributions:** (D3)

This course is cross-listed and the prefixes carry the following divisional credit:

STS 376(D2) CSCI 376(D3)

**Attributes:** COGS Interdepartmental Electives

Not offered current academic year

CSCI 379 (S) Causal Inference (QFR)

Does X cause Y? If so, how? And what is the strength of this causal relation? Seeking answers to such causal (as opposed to associational) questions is a fundamental human endeavor; the answers we find can be used to support decision-making in various settings such as healthcare and public policy. But how does one tease apart causation from association--early in our statistical education we are taught that "correlation does not imply causation." In this course, we will re-examine this phrase and learn how to reason with confidence about the validity of causal conclusions drawn from messy real-world data. We will cover core topics in causal inference including causal graphical models, unsupervised learning of the structure of these models, expression of causal quantities as functions of observed data, and robust/efficient estimation of these quantities using statistical and machine learning methods. Concepts in the course will be contextualized via regular case studies.

**Requirements/Evaluation:** Problem sets, programming exercises, empirical analyses, case studies, and a final project.

**Prerequisites:** CSCI 136, and either CSCI 256 or STAT 201/202.
Enrollment Limit: 24
Enrollment Preferences: Computer science majors and prospective majors.
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: This course heavily relies on discrete mathematics, algorithms, and elementary statistics. There will be regular assignments requiring rigorous quantitative or formal reasoning.
Attributes: COGS Interdepartmental Electives
Not offered current academic year

CSCI 381  (F) Deep Learning  (QFR)
This course is an introduction to deep neural networks and how to train them. Beginning with the fundamentals of regression and optimization, the course then surveys a variety of neural network architectures, which may include multilayer feedforward neural networks, convolutional neural networks, recurrent neural networks, and transformer networks. Students will also learn how to use deep learning software such as PyTorch or Tensorflow.
Requirements/Evaluation: Evaluation based on assignments, projects, and exams.
Prerequisites: CSCI 136 and fulfillment of the Discrete Mathematics Proficiency requirement
Enrollment Limit: 24
Enrollment Preferences: Current or expected Computer Science majors
Expected Class Size: 24
Grading: no pass/fail option, no fifth course option
Distributions: (D3) (QFR)
Quantitative/Formal Reasoning Notes: The course will consist of programming assignments and problem sets in which quantitative/formal reasoning skills are practiced and evaluated.
Attributes: COGS Interdepartmental Electives

Requirements/Evaluation: To be determined by supervising faculty member.
Prerequisites: permission of department
Enrollment Limit: none
CSCI 432  (F)  Operating Systems  (QFR)
This course explores the design and implementation of computer operating systems. Topics include historical aspects of operating systems development, systems programming, process scheduling, synchronization of concurrent processes, virtual machines, memory management and virtual memory, I/O and file systems, system security, os/architecture interaction, and distributed operating systems.

Requirements/Evaluation: several implementation projects that will include significant programming, as well as written homework, and up to two exams

Prerequisites: CSCI 237 and either CSCI 256 or 334

Enrollment Limit: 24

CSCI 493  (F)  Research in Computer Science
This course provides highly-motivated students an opportunity to work independently with faculty on research topics chosen by individual faculty. Students are generally expected to perform a literature review, identify areas of potential contribution, and explore extensions to existing results. The course culminates in a concise, well-written report describing a problem, its background history, any independent results achieved, and directions for future research.

Requirements/Evaluation: class participation, presentations, and the final written report

Prerequisites: none

Enrollment Limit: none

CSCI 494  (S)  Senior Thesis: Computer Science
Computer Science thesis; this is part of a full-year thesis (493-494).

Requirements/Evaluation: class participation, presentations, and the final written report

Prerequisites: CSCI 493

Enrollment Limit: none
Enrollment Preferences: open to senior Computer Science majors with permission of instructor

Winter Study

CSCI 10  (W) Unix and Software Tools
This course serves as a guided introduction to the Unix operating system and a variety of software tools. Students in this course will work on Unix workstations, available in the Department's laboratory. By the end of the course, students will be familiar with Unix and will be able to use Git as a collaborative tool. As a final project, students will work together in teams to explore an API of their choice. The exact topics to be covered may vary depending upon the needs and desires of the students. The course is designed for individuals who understand basic program development techniques as discussed in an introductory programming course (Computer Science 134 or equivalent), but who wish to become familiar with a broader variety of computer systems and programming languages. This course is not intended for students who have completed a course at the 200 level or above.

Requirements/Evaluation: Presentation(s); Creative project(s)

Prerequisites: CSCI 134 or equivalent programming experience
CSCI 13  (W) User Experience Design: Designing for People
Many innovative products and entrepreneurial endeavors fail because they are not sensitive to the attitudes and behaviors of the people who interact with them. The fields of User Experience (UX) Design and Design Thinking combine aspects of psychology with software development, behavioral economics, architecture, and other fields, to create products and processes that provide an easy, enjoyable, efficient, and safe user experience. The course will provide students with a theoretical framework for analyzing usability, as well as practical experience with iterative design techniques, prototyping, and user testing and feedback. Students will demonstrate their understanding of UX theory through short presentations and participation in class discussions. Students will work in small groups to identify a usability problem and design a solution which they will evaluate by heuristic analysis and usability testing with human test subjects.

Requirements/Evaluation:  Presentation(s); Creative project(s)
Prerequisites:  None
Enrollment Limit:  12
Enrollment Preferences:  The instructor seeks a diverse group of students with interests in psychology, design, human-computer interaction, entrepreneurship, and other fields
Expected Class Size:  NA
Grading:  pass/fail only
Unit Notes:  Rich Cohen '82 has designed communications, social networking, and education applications used by over 100 million people and has conducted usability research on five continents.
Attributes:  EXPE Experiential Education Courses  STUX Winter Study Student Exploration
Not offered current academic year

CSCI 17  Fiber Arts for All
While fast fashion has taken over our lifestyles, the technology historically used to create our garments remain available to us today. In this class, we will focus specifically on the process of turning protein (animal) fiber into yarn, and into appealing fabric through handspinning, dyeing, tapestry weaving, and crocheting. We will use tools and techniques that are financially responsible, often leveraging found objects, to show that almost anyone can participate in the slow fashion and local fibershed movements.

Class Format:  Class will be a combination of lecture and hands-on practice, while significant time outside of class will be dedicated to further practice and content delivery through videos, podcasts, and readings.
Requirements/Evaluation:  Project(s); Presentation(s)
Prerequisites:  NA
Enrollment Limit:  15
Enrollment Preferences:  NA
Expected Class Size:  15
Grading:
Materials/Lab Fee:  $200
Not offered current academic year

CSCI 18  The Evolution of Magic: The Gathering - Deck Archetypes and Strategies from 1993 to Today
Magic: The Gathering is a collectible card game that has been in continuous development since 1993 and has featured regular high-level professional events since Pro Tour New York in 1996. In these competitive events, players construct their own sixty-card decks that must conform to the deckbuilding restrictions of the particular tournament environment. New card designs are regularly developed, and the release of these cards in new expansions increases the size of the available card pool and also introduces new rules and strategies to the game. Since competitive decks must carefully consider card synergies, the design of newly introduced cards influences the balance among various competitive strategies. This class will study the evolution of deck designs throughout Magic's thirty-year existence. It will focus on the elements that define classic archetypes, so-called "Aggro", "Combo", and "Control", as well as elements that define the hybrid strategies present in many tournament environments. By studying representative tournament environments from different Magic eras, we will appreciate the ways that shifts in card design philosophy continuously shape tournament metagames.

Requirements/Evaluation: Paper(s) or report(s); Other: participation in competitive play and write-ups

Prerequisites: Knowledge of Magic the Gathering rules and gameplay experience. Interest in competitive play and tournament analysis.

Enrollment Limit: 12

Enrollment Preferences: Students with greater depth of magic-playing experience.

Expected Class Size: NA

Grading: Unit Notes: Mark Tocco has been playing Magic: the Gathering since 1998 and has had a history of competitive Magic the Gathering success, including winning the Vintage World Championship in 2014. He now makes his living with card games, including poker.

Materials/Lab Fee: $20

Attributes: SLFX Winter Study Self-Expression STUX Winter Study Student Exploration

CSCI 19  Law, Cybersecurity, and Society

The connected world presents a new set of capabilities, and associated risks. In this course, we will explore the intersection of cybersecurity, legal frameworks, jurisdictions, and the ethics linking them all. Using examples of past hacking incidents, we will work together to identify and explore different vulnerabilities inherent in today's systems and technologies that hackers exploit. Simultaneously, we will explore the costs and benefits implicit in various approaches to regulating these different hacking behaviors through societal mores and political, economic and legal mechanisms. By the end of the course, students will be familiar with important cybersecurity events and changes, how they have influenced the law, and how the law has shaped the development of the modern connected world. The evaluation will be through a paper of 10 pages or less, or other approaches agreed upon with the instructors.

Requirements/Evaluation: Paper(s) or report(s); Presentation(s); Other: Certain projects may be appropriate, after consultation with the instructors.

Prerequisites: This course is designed to be accessible to any student; no requirement to be in the Computer Science major.

Enrollment Limit: 24

Enrollment Preferences: Should the course be over-enrolled, priority will be given first to seniors, then juniors, and so on.

Expected Class Size: NA

Grading: Unit Notes: Richard Ward '89 is a Technical Fellow at Microsoft Corp, where he currently heads security assurance for platform products. He has been at Microsoft for 35 years, across numerous projects as well as credited with 40 patents.

Attributes: EXPE Experiential Education Courses STUX Winter Study Student Exploration

CSCI 23  (W) Research and Development in Computing

An independent project is completed in collaboration with a member of the Computer Science Department. The projects undertaken will either involve the exploration of a research topic related to the faculty member's work or the implementation of a software system that will extend the students design and implementation skills. It is expected that the student will spend 20 hours per week working on the project. At the completion of the project, each student will submit a 10-page written report or the software developed together with appropriate documentation of its behavior and design. In addition, students will be expected to give a short presentation or demonstration of their work. Prior to the beginning of the Winter Study registration period, any student interested in enrolling must have arranged with a faculty member in the department to serve as their supervisor for the course.

Requirements/Evaluation: short paper and final project or presentation
Prerequisites: project must be pre-approved by the faculty supervisor

Enrollment Limit: 30

Enrollment Preferences: preference given to sophomores and juniors

Expected Class Size: NA

Grading: pass/fail only

Attributes: EXPE Experiential Education Courses, STUX Winter Study Student Exploration

Not offered current academic year

CSCI 31 (W) Senior Thesis: Computer Science

To be taken by students registered for Computer Science 493-494.

Class Format: independent study

Requirements/Evaluation: Determined by faculty advisors

Prerequisites: CSCI 493

Enrollment Limit: 10

Enrollment Preferences: Current thesis students

Expected Class Size: 10

Grading: pass/fail only

Not offered current academic year

CSCI 36 (W) Intro to Healthcare

This class will focus on current topics in healthcare (e.g. burnout, health disparities, holistic therapies, communication, health literacy) with the primary objective aimed at exploring career options within the larger healthcare setting. Required reading, viewing, and/or listening assignments will inform classroom discussions. Relevant readings will be taken from books, academic journals, and periodicals. Students will be asked to write weekly reflections that will be used as a tool to contextualize course content and note areas that are of particular interest (or disinterest). Classes will be held primarily in person on Monday, Wednesday, and Thursday evenings between 7 and 9 pm. Selected scheduled classes may be held remotely via Zoom as needed. In-person class time will consist of a combination of short lectures, classroom discussions, and invited talks by individuals who are currently working or who have extensive experience in a broad spectrum of healthcare fields. Weekly reflection: This is a weekly 1-2 page paper reflecting on a speaker/reading/assignment done that week in class. This does not need to be a scholarly paper -- meaning no need for formal citations or a reference page -- but this should be well written and thought out. Weekly questions: In every class we will have at least one speaker. Please take some time each week to develop a few thought-out questions in an effort to facilitate discussion. Final paper/project: This can be either a scholarly 5-page paper, a 30-minute presentation, or a combination thereof. This final project can be about anything relating to healthcare that is of interest to you. You may utilize any topics/material we used in class or draw on your own experiences and research. This assignment will be due in the final week of class.

Requirements/Evaluation: Paper(s) or report(s); Presentation(s)

Prerequisites: An interest in a career in healthcare is helpful but not required

Enrollment Limit: 15

Enrollment Preferences: Random lottery

Expected Class Size: NA

Grading: pass/fail only

Unit Notes: Sophie is a family nurse practitioner with 8 years of experience working in the healthcare field.

Attributes: STUX Winter Study Student Exploration, WELL Winter Study Wellness

Not offered current academic year

CSCI 99 (W) Independent Study: Computer Science

Open to upperclass students. Students interested in doing an independent project (99) during Winter Study must make prior arrangements with a faculty sponsor. The student and professor then complete the independent study proposal form available online. The deadline is typically in late
September. Proposals are reviewed by the pertinent department and the Winter Study Committee. Students will be notified if their proposal is approved prior to the Winter Study registration period.

**Class Format:** independent study

**Grading:** pass/fail only

**Distributions:** (D3)

*Not offered current academic year*
